

ABSTRACT OF THE DISCLOSURE

A camera body consists of a main body, a front cover, and a rear cover. A cylindrical battery chamber with its back open is mounted on the main body. A battery for supplying electricity to each electric circuit is loaded into the battery chamber. Inside of the battery chamber has a negative contact member and a positive contact member. The negative contact member has an arm, which brings in contact with the inner wall of the front cover electrically. The front cover has conductivity and functions as a ground. As the negative pole of the battery is connected to the front cover of large volume, the electric circuit is not affected by electrostatic noise, to cause malfunction.
